

# Managed detection and response

## Next-gen cybersecurity that gives you 24/7 protection

Cyber threats are becoming more sophisticated – and more common. Organizations need strong detection and response abilities in order to act on threats before they turn into breaches.

Wipfli's managed detection and response (MDR) service combines technology and human expertise to give you high-speed protection. It's a solution that delivers advanced threat detection, extensive threat analytics, global threat intelligence, faster incident mitigation and collaborative breach management – all on a 24/7 basis.

Reduce the time it takes to detect a breach from over 200 days to **just hours and minutes.**

## High-speed attacks require high-speed defense

MDR combines machine learning, security automation and human intelligence to rapidly detect advanced threats. By identifying threats in real-time and validating them in minutes, your response time is no longer measured in days and weeks. It's now hours and minutes.

## Strengthen traditional security services

Your traditional IT services and internal IT support still have an important role to play, but when it comes to security, they may no longer be enough on their own. MDR can augment your IT security in a cost-effective way to improve response time, mitigate risk and get you the maximum return on your investment.

# High-speed, high-touch, 24/7 protection

Experience an active, next-level defense that leaves yesterday's passive security monitoring where it belongs.

## Threat anticipation

A key part of our MDR solution is gathering data and intelligence on threats and attacks worldwide. We identify if you might be the next target and let you know what actions to take to protect your digital assets before an attack can be launched against you.

## Threat hunting

Using data science models and machine-learning algorithms to detect suspicious activities, we proactively hunt for hidden threats to your environment. Plus, specialized teams analyze the data to detect threats that may have gone undetected by other security controls.

## Security monitoring

By collecting and analyzing your logs and security events, we can set up rules that will then detect known attacks and take action in real time. Our team provides you with 24/7 alerts, log management, infrastructure monitoring and compliance-ready reporting.

## Incident analysis

We combine forensic automation with skilled analysts to investigate threats to your organization. By using automation to identify the attack chain, potential impact and the threat actors themselves, we can rapidly deliver detailed incident-mitigation steps.

## Auto containment

Internal security teams are often understaffed and overworked. But auto containment takes one critical security task out of their hands. As soon as our AI detects a threat, like ransomware, we can automatically deploy countermeasures to stop it from spreading.

## Incident response

Wipfli's response is rapid, coordinated and effective in safeguarding your enterprise. Our incident responders investigate attacks, contain the impact and restore your data and systems to a protected state. By collaborating with your in-house teams where needed, we can take immediate action.

## Compliance

With Wipfli's MDR services, you can generate customizable reports to show compliance with various regulatory requirements. Our solution also includes security event monitoring, event log monitoring and retention, and automated audit trails.

## Let's get started

Gain 24/7 protection for your business with Wipfli's scalable, affordable, state-of-the-art MDR solutions.
